

## Scenario Name

*Scenario 1 — Search Functionality*

## Weak Prompt

*Test the search feature.*

## What I Feel is Missing

*No product type (e-commerce, hospital), no filter/sort behaviour, no empty/invalid input scenarios, no performance angle.*

## Instruction

*Validate the search field in the home page for various positive and negative scenarios as per the requirements - Only alphabets are allowed. Numeric and special characters should not be accepted. If invalid search criteria are given an error message should be displayed*

## Context

*This field is applicable for only state search. The suggestions should start appearing as and when the user starts typing*

## Example

*Karnataka| Bengaluru| Bengaluru is multilingual, multicultural with great climatic conditions.*

## Persona

*Act as QA Engineer*

## Output Format

*Output should be in a grid format displaying the state in column 1, state capital in column 2 and what it is famous for in column 3*

## Tone

*The tone of the text in column 3 should be professional as the end users are clients belonging to that specific state*

## Rewritten Prompt

*As QA Engineer, Validate the search field in the home page for various positive and negative scenarios as per the requirements - Only alphabets are allowed. Numeric and special characters should not be accepted. If invalid search criteria are given an error message should be displayed. This field is applicable for only state search. The suggestions should start appearing as and when the user starts typing. Output should be in a grid format displaying the state in column 1, state capital in column 2 and what it is famous for in column 3. The tone of the text in column 3 should be professional as the end users are clients belonging to that specific state. Example - Karnataka| Bengaluru| Bengaluru is multilingual, multicultural with great climatic conditions. Please proceed with the validation and populate the table for at least five diverse Indian states to demonstrate compliance with these specifications.*

## Observations

*Initial response provides a random response with no proper context understanding but ICEPOT technique has helped achieve accurate results as expected.*

### **Initial Response:**

Test the search feature.

The search feature is functioning correctly. As of 4:45 PM on Tuesday, July 14, 2026, the current time in Bengaluru, Karnataka, India, is confirmed.

### **ICEPOT response:**

As a QA Engineer, I have performed the requested validation on the home page state-search field, ensuring that it exclusively accepts alphabetic characters while triggering dynamic, relevant auto-suggestions as the user types; any attempts to input numeric or special characters are successfully blocked, consistently triggering the required error message. Below are the results of this validation presented in the requested format:

| State       | State Capital | Fame/Highlight                                                                                                                                               |
|-------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Karnataka   | Bengaluru     | Recognized globally as the technology hub of India, distinguished by its vibrant innovation ecosystem and significant contributions to the global IT sector. |
| Maharashtra | Mumbai        | Renowned as the financial and commercial heart of the nation, providing unparalleled opportunities in industry, commerce, and global trade.                  |

## Scenario Name

*Scenario 2 — File Upload*

### **Weak Prompt**

*Generate test cases for file upload*

### **What I Feel is Missing**

*No file types, no size limits,*

*no success/failure criteria, no security angle (malicious file upload).*

**Instruction**

*Create test cases to upload only PDFs not accepting file size greater than 50KB. Error message should be displayed if submit is clicked without uploading files or incorrect type is used. Each and every file should be scanned before uploading.*

**Context**

*The portal used is a government portal and hence documents should be handled confidentially*

**Example**

*A PDF file with size < 50 KB should be uploaded without any issue after scanning*

**Persona**

*Act as a government servant.*

**Output Format**

*Successful message or Failure message based on the file upload should be displayed on top of the screen*

**Tone**

*Message displayed should be very professional as it's a government site*

 **Rewritten Prompt**

*Acting as a professional civil servant, please draft a comprehensive set of test cases for a government portal's file upload feature, ensuring all actions prioritize data confidentiality. The system must strictly accept only PDF files under 50 KB, mandate a security scan for every file, and trigger formal error messages for missing files, incorrect formats, or oversized documents. Please include test scenarios for successful uploads and ensure that all status notifications—whether success or failure—are displayed in a professional, authoritative tone at the top of the screen.*

**Observations**

*Technical accuracy was missing*

**Initial output**

Here is a comprehensive guide and a checklist of test cases for a **File Upload** feature. I've broken them down into logical categories to ensure you cover everything from basic functionality to security.

## 1. Functional Test Cases (The Happy Path & Basic Rules)

These test cases verify that the basic uploading mechanism works as designed under normal conditions.

| Test Case ID | Description                                                                                   | Expected Result                                            |
|--------------|-----------------------------------------------------------------------------------------------|------------------------------------------------------------|
| FT-01        | Upload a valid file with an allowed extension (e.g., <code>.pdf</code> , <code>.jpg</code> ). | File uploads successfully; a success message is displayed. |

### ICEPOT response

| TC Number | Step                                     | Expected Result                                                                                                                   |
|-----------|------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|
| TC-01     | Upload a valid PDF file (< 50 KB).       | File passes security scan; "Success: Your document has been submitted successfully." appears at the top.                          |
| TC-02     | Upload a non-PDF file or a PDF > 50 KB.  | System rejects the file; "Error: Invalid file type or size. Please ensure the document is a PDF under 50 KB." appears at the top. |
| TC-03     | Click "Submit" without selecting a file. | System prevents submission; "Error: No file selected. Please upload a document to proceed." appears at the top.                   |

### Scenario Name

Scenario 7 — Dashboard / Report Generation

### Weak Prompt

*Test the reports section.*

### **What I Feel is Missing**

*No report type (PDF/Excel/CSV), no date range filters,  
no data accuracy validation, no permission-based visibility.*

### **Instruction**

*Test the status report for excel format with diagrammatic representation including mathematical details restricting permission to all others except the manager*

### **Context**

*This report is available in the jira by accessing the files in local*

### **Example**

*Test the weekly status report for format, bar diagrams, details etc*

### **Persona**

*Act as a manager*

### **Output Format**

*Output should show the observations from generated report. Only incorrect details in red colour.*

### **Tone**

*Tone of the report should be formal*

### **Rewritten Prompt**

*Acting in my capacity as Manager, I am tasking you with conducting a formal quality assurance review of the weekly status report exported from Jira to Excel. Please verify the structural integrity of the file, the accuracy of the diagrammatic representations, and the validity of all included mathematical data. A critical component of this audit is to ensure that document permissions are correctly configured, restricting access exclusively to the Manager while blocking all other users. Upon completion of your review, please present a formal report detailing your observations, ensuring that any incorrect data points, formatting inconsistencies, or security lapses are highlighted in **red** to facilitate immediate remediation.*

### **Observations**

*Format is not as expected*

### **Initial output**

Testing a **Reports** section requires a mix of data validation, UI responsiveness, performance testing, and export accuracy. Because reports often handle massive datasets and complex filtering, the edge cases are highly specific.

Here is a comprehensive checklist of test cases for a Reports section, organized by category.

## 1. Filter & Search Functionality

Reports are only as useful as their filters. These cases ensure users can accurately slice and dice data.

| Test Case ID | Description                                                  | Expected Result                                                 |
|--------------|--------------------------------------------------------------|-----------------------------------------------------------------|
| REP-FL-01    | Apply a single filter criteria (e.g., Status = "Completed"). | Report updates instantly to show <i>only</i> completed records. |

**ICEPOT output**

To: Project Management Office  
Subject: Audit Report: Weekly Status Report – Excel Export Review

As the Manager, I have conducted a formal review of the weekly status report exported from Jira to Excel. The primary objective of this audit was to ensure data accuracy, proper diagrammatic representation, and the enforcement of restricted access protocols. Please find my observations regarding the generated report below, with non-compliant or erroneous findings highlighted in red for your immediate attention.

**Audit Observations**

- **Document Format and Structure:** The layout adheres to the established departmental standards for professional reporting.
- **Diagrammatic Representation:** The bar diagrams accurately reflect the current distribution of active tasks across the workstreams.
- **Mathematical Data Integrity:** The calculation for resource utilization ratios contains a formulaic error, resulting in skewed percentage outputs that do not correlate with the underlying Jira data.
